- Workshop CAD and grids are provided with AoA and flap angle built-in
- Pressure coefficients are based on inlet static pressure and density: CFD results that set back pressure at tunnel exit should use converged inlet static pressure as reference when computing C_p .

NASA Glenn Research Center Icing Research Tunnel Cloud Calibration data

- This data is provided as recommendation for setting numerical simulation parameters
- Below is the cloud uniformity map for MVD = 20 μm and $V = 150$ knots take from NASA TM 2015-218758. The contour levels are ice thickness on the grid normalized by the average of the center 12 locations. Note that the test section is 72-inches tall.

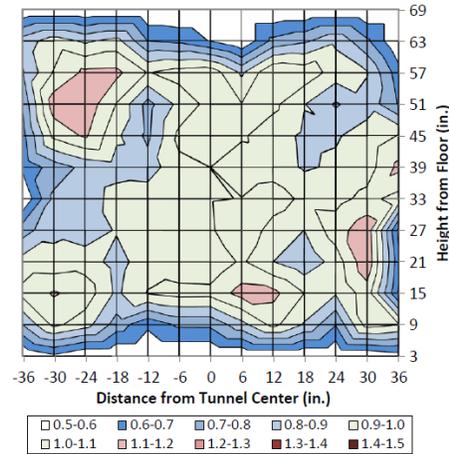

Figure 2.—A technician measures the thickness of ice accreted on the Grid.

- IRT distribution is different than Langmuir-D, the table below lists the recommended 7-bin distribution
